

Scale Matters; Quality Counts

Securing sustainability through the CFP Reform

We, the undersigned organisations, representing artisanal coastal and inland fishworkers, development and environmental NGOs and other stakeholders, share a common interest in placing European fisheries on a sustainable footing by supporting the reform of the Common Fisheries Policy (CFP) in ways which ensure the recovery of fish stocks and habitats, the promotion of best practice, a just allocation of fishing access based on social and environmental criteria, and an equitable distribution of the benefits derived from these activities.

New fisheries policies that reward best practices with preferential access to fish resources, and target capacity reduction programmes so as to eliminate the most harmful fishing methods would go a long way to placing European fisheries on a more sustainable footing.

This was recognized in the European Parliament resolution on the Green Paper adopted in February 2010. The resolution highlighted that, although local fishing communities should be given primary access to fish stocks, access rights should no longer be based solely on the criterion of historical catches. Rather, environmental and social criteria should gradually be introduced to determine who should have access to fishery resources, where the use of such criteria could foster a dynamic that would lead to improved fishing practices and a more environmentally, socially and economically sustainable fishing industry.¹

A significant proportion of the European fleet is small in scale and fishes in a non-intensive manner, using a range of seasonally diverse fishing methods on a range of species, with a relatively low impact on the ecosystem. This artisanal segment of the coastal and inland fisheries generates considerable ancillary jobs and provides the social, economic and cultural fabric that sustains many communities, where it makes an important contribution to food supplies and political, social and economic stability. This has been highlighted in the 2009 Statement from the Brussels Workshop on Common Fisheries Policy Reform in the European Union and Small-Scale Fisheries² and in the 2010 A Coruña Statement³, amongst others. However, the qualitative aspects of different fishing gears and practices have been largely overlooked by the Commission in its reform package.

Coastal artisanal fishers are likely to be marginalised under the compulsory regime of Transferable Fishing Concessions as proposed by the Commission. Such a regime will favour the most economically powerful enterprises rather than the most sustainable fishery activities. However, if treated fairly, managed responsibly and given well defined fishing access, these kinds of fishery activities have the potential to deliver healthy fisheries and sustainable livelihoods over the long-term.

European Commission projections show employment in the fish catching sector is set to decline by 60% over the next 10 years, with the heaviest losses falling on the artisanal sector, which employs around 65% of the fisheries workforce.

Scale Matters; Quality Counts
Securing sustainability through the CFP Reform

We therefore call on the Members of the European Parliament, the Member States of the EU, and the Commissioner for Fisheries and Maritime Affairs to turn the tide by:

- Providing priority access to fish resources to those who fish in the most environmentally and socially sustainable way. Sustainability criteria should rank access to resources, favouring those who have the least impact on the marine environment, who can demonstrate compliance and who operate within and contribute to local communities;
- Revoking the compulsory nature of the proposed Transferable Fishing Concessions (TFCs) scheme and providing a range of tools to be selected and adapted to enable the allocation of access to fishing opportunities based on sustainability criteria;
- Including firm timelines for the development and adoption of multiannual plans that apply the appropriate measures through genuine bottom-up, participative co-management processes, through co-management committees, and giving due weight to sustainable development while ensuring the involvement and collaboration of all segments in the sector and stakeholders; and
- Establishing and applying clear conditions and protocols to avoid conflicts between different users targeting shared stocks or common fishing grounds.
